Rules of Exponents

Name	Rule	Example
Product	$a^m \cdot a^n = a^{m+n}$	$x^3 \cdot x^4 = x^{3+4} = x^7$
Quotient	$a^m \div a^n = a^{m-n}$	$p^5 \div p^2 = p^{5-2} = p^3$
Power of a Power	$(a^m)^n = a^{mn}$	$(z^3)^2 = z^{3 \cdot 2} = z^6$
Power of a Product	$(ab)^m = a^m b^m$	$(3y)^2 = 3^2 y^2 = 9y^2$
Power of a Quotient	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$	$\left(\frac{5}{3}\right)^2 = \frac{5^2}{3^2} = \frac{25}{9}$
Zero Exponent	$a^0 = 1$	$x^0 = 1; 6^0 = 1; 0^0 = 1$
Negative Exponent	$a^{-m} = \frac{1}{a^m}$	$b^{-3} = \frac{1}{b^3}; 5^{-2} = \frac{1}{5^2}$
Fractional Exponent	$a^{\frac{m}{n}} = \sqrt[n]{a^m}$	$4^{\frac{3}{2}} = \sqrt[2]{4^3} = \sqrt{64} = 8$

Square Root Tricks

Combining of Similar Radicals

$$a\sqrt{b} + a\sqrt{b} = (a + a)\sqrt{b}$$

$$a\sqrt{b} - c\sqrt{b} = (a - c)\sqrt{b}$$

Example 1: $2\sqrt{5} + 6\sqrt{5} = (2 + 6)\sqrt{5} = 8\sqrt{5}$

Example 2: $3\sqrt{2} - 5\sqrt{2} = (3 - 5)\sqrt{2} = -2\sqrt{2}$

Splitting Products

$$\sqrt{x^3} = \sqrt{x^2 \cdot x} = \sqrt{x^2} \sqrt{x} = x\sqrt{x}$$

$$\sqrt{20} = \sqrt{4 \cdot 5} = \sqrt{4} \cdot \sqrt{5} = 2\sqrt{5}$$

Splitting Quotients

$$\sqrt{\frac{x^2}{y^2}} = \frac{\sqrt{x^2}}{\sqrt{y^2}} = \frac{x}{y}$$

$$\sqrt{\frac{4}{25}} = \frac{\sqrt{4}}{\sqrt{25}} = \frac{2}{5}$$

Square and Square Root Exercise

Simplify $2\sqrt{2}(2\sqrt{3} + 3\sqrt{3})$

Simplify $3\sqrt{24x^3}$

Simplify $(-4\sqrt{2})^2$

Simplify $\sqrt{\frac{12x^2}{4}}$

Cube and Cube Root Exercise

Simplify $2\sqrt{2}(2\sqrt{3} + 3\sqrt{3})$

Simplify $3\sqrt{24x^3}$

Simplify $(-4\sqrt{2})^2$

Simplify $\sqrt{\frac{12x^2}{4}}$

Cube and Cube Root Tricks

Combining of Similar Radicals

$$a\sqrt[3]{b} + a\sqrt[3]{b} = (a + a)\sqrt[3]{b}$$

$$a\sqrt[3]{b} - c\sqrt[3]{b} = (a - c)\sqrt[3]{b}$$

Example 1: $2\sqrt[3]{5} + 6\sqrt[3]{5} = (2 + 6)\sqrt[3]{5} = 8\sqrt[3]{5}$

Example 2: $3\sqrt[3]{2} - 5\sqrt[3]{2} = (3 - 5)\sqrt[3]{2} = -2\sqrt[3]{2}$

Splitting Products

$$\sqrt[3]{x^4} = \sqrt[3]{x^3 \cdot x} = \sqrt[3]{x^3} \cdot \sqrt[3]{x} = x\sqrt[3]{x}$$

$$\sqrt[3]{16} = \sqrt[3]{8 \cdot 2} = \sqrt[3]{8} \cdot \sqrt[3]{2} = 2\sqrt[3]{2}$$

Splitting Quotients

$$\sqrt[3]{\frac{x^3}{y^3}} = \frac{\sqrt[3]{x^3}}{\sqrt[3]{y^3}} = \frac{x}{y}$$

$$\sqrt[3]{\frac{27}{125}} = \frac{\sqrt[3]{27}}{\sqrt[3]{125}} = \frac{3}{5}$$

Undefined Value Over the Set of Real Numbers

There are two types of expressions that are undefined over the set of real numbers:

- Fractions with zero in the denominator (or an expression equivalent to zero)

$$\text{Examples: } \frac{-3}{0}; \frac{0}{0}; \frac{x-3}{x+3}, \text{ where } x = -3$$

- Square roots of negative numbers (or expressions which, when simplified, result in negative numbers).

$$\text{Examples: } \sqrt{-1}; x^2 + 1 = 0; \sqrt{-3x^2}; \sqrt{x^3 - 2}, \text{ where } x = -1$$

Imaginary Numbers

Try squaring numbers to see if we can get a negative result.

$$1^2 = 1 \quad 0^2 = 0 \quad (-2)^2 = 4 \quad (0.2)^2$$

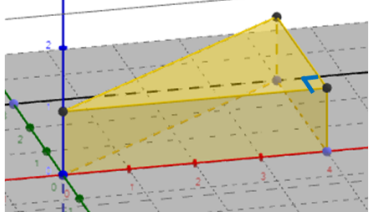

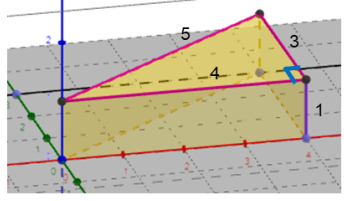

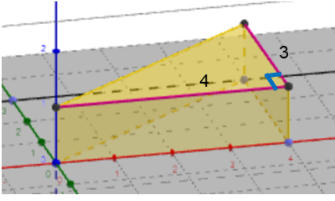

“**Imagine**” there is such a number. Let’s call this number *i* for imaginary. Then we can do this...

$$i^2 = i \cdot i = -1$$

“**Imagine**” there is such a number, called *i* for imaginary. Then we can also do this...

$$\begin{aligned} \sqrt{i^2} &= \sqrt{i \cdot i} = \sqrt{-1} \\ i &= \sqrt{-1} \end{aligned}$$

Anchor Chart: Surface Area of Right Triangular Prisms

Surface Area of Right Triangular Prisms	
$SA = ph + 2B$ 	
<p>1 Perimeter of the Base and Height</p>  <p style="text-align: center;">p and h</p> $p = (3 + 4 + 5)$ $p = 12$ $h = 1$	<p>2 Area of the Base B</p>  $B = \frac{1}{2}bh$ $B = \frac{1}{2}(3 \cdot 4)$ $B = \frac{1}{2}(12) = 6$
<p>3 Solve</p> $SA = ph + 2B$ $SA = (12)(1) + 2(6)$	$SA = 12 + 12$ $SA = 24$

Real World Problems with Inequalities

Instructions: Solve the problem.

Annie is planning a business meeting for her company. She has a budget of \$1,325 for renting a meeting room at a local hotel and providing lunch. She expects 26 people to attend the meeting. The cost of renting the meeting room is \$270. Write an inequality to show how to find the amount, x , Annie can spend on lunch for each person?

The Concept of Slope

Forms of Linear Equation

Forms of Linear Equations	Equations
Slope-Intercept Form	$y = mx + b$
Point-Slope Form	$y - y_1 = m(x - x_1)$
Standard Form	$cx + dy = e$

m = slope

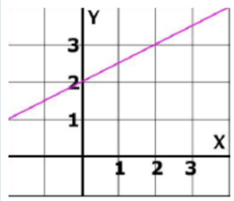

b = y-intercept

(x_1, y_1) = a point on the line

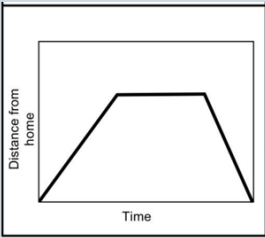

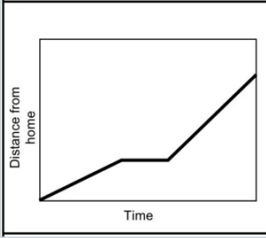

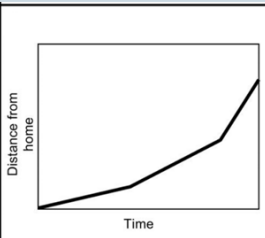

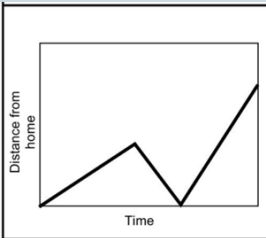

c , d and e are constants

Anchor Chart: Finding Slope

T-Chart	Slope-Intercept	Standard	Graph								
<p>Use the slope formula.</p> $m = \frac{(y_2 - y_1)}{(x_2 - x_1)}$ <p>Example:</p> <table border="1"> <thead> <tr> <th>x</th> <th>y</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>-9</td> </tr> <tr> <td>3</td> <td>-6</td> </tr> <tr> <td>5</td> <td>-3</td> </tr> </tbody> </table> $m = \frac{-3 - (-9)}{5 - 1}$ $m = \frac{6}{4} = \frac{3}{2}$	x	y	1	-9	3	-6	5	-3	<p>Locate m in the equation.</p> $y = mx + b$ <p>Example:</p> $y = 3x - 4$ <p style="text-align: center;">↓</p> $y = mx + b$ $m = 3$	$cx + dy = e$ <p>Transform equation to slope-intercept form and locate m in the equation.</p> <p>Example:</p> $3x + 9y = 4$ $\frac{-3x}{9} \quad \frac{-3x}{9}$ $9y = -3x + 4$ $\frac{9y}{9} = \frac{-3x}{9} + \frac{4}{9}$ $y = \frac{-3}{9}x + \frac{4}{9}$ $m = \frac{-3}{9}$	 <p>Locate two points on the graph, then use the slope formula.</p> <p>Example:</p> <p>(0,2) and (2,3)</p> $m = \frac{(y_2 - y_1)}{(x_2 - x_1)}$ $m = \frac{3 - 2}{2 - 0}$ $m = \frac{1}{2}$
